

## Using a Mirror

We recommend you use a mirror to download our release builds, but you **must** verify the integrity of the downloaded files using signatures downloaded from our main distribution directories. Recent releases (48 hours) may not yet be available from the mirrors.

You are currently using <https://mirrors.estointernet.lv/apache/>. If you encounter a problem with this mirror, please select another mirror. If all mirrors are failing, there are backup mirrors (at the end of the mirrors list) that should be available.

Other mirrors: <https://mirrors.estointernet.lv/> [Change](#)

The [KEYS](#) link links to the code signing keys used to sign the product. The [PGP](#) link downloads the OpenPGP compatible signature from our main site. The [SHA256](#) link downloads the checksum from the main site.

## Apache Commons Math (3.6.1+)

### Binaries

## WHAT'S NEW

This is a bug fix and refactoring release. The following updates have been made:

- Removed the dependency on the flanagan library. It is now replaced with Apache Math. The implementation and interface of the MathUtil has been changed accordingly.
- The minimal time between events is now configurable.
- Fixed Issue 44: UtilizationModelPlanetLabInMemory: use a global constant to define the size of the data field; a new constructor for the classes, allowing definition of data size, was added.
- Fixed Issue 49: Wrong calculation of debt during migration: all references to debt from Datacenter and its subclasses were removed.

### Assets 4
